

EXHIBIT 009

U.S. Patent No. 7,594,052 (Radulescu & Goossens)**“Integrated circuit and method of communication service mapping”**

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
6. Method of communication service mapping in an integrated circuit, having a plurality of processing modules (M, S),	<p>Without conceding that the preamble of claim 6 of the '052 Patent is limiting, Qualcomm Incorporated and Qualcomm Technologies, Inc.'s (together, “Qualcomm”) Snapdragon 8+ Gen 1 Mobile Platform (hereinafter, the “Snapdragon SoC”) is an integrated circuit and performs a method of communication service mapping in an integrated circuit, having a plurality of processing modules (M, S), either literally or under the doctrine of equivalents.</p> <div data-bbox="508 492 636 613">  </div> <h2 data-bbox="661 527 1606 584">Snapdragon 8+ Gen 1 Mobile Platform</h2> <p data-bbox="508 803 1732 868">New power and performance enhancements deliver the ultimate boost across all your on-device experiences.</p> <p data-bbox="508 933 1711 1120">The Snapdragon® 8+ Gen 1 Mobile Platform is our premium-tier powerhouse. Qualcomm® Adreno™ GPU offers a 10% increase in GPU clock speeds and 30% GPU power reduction while the Qualcomm® Kryo™ CPU provides 10% better CPU performance and 30% CPU improved power efficiency. Plus, this platform delivers additional power savings and extended performance across the board—including over 80 minutes longer video streaming and more than 50 minutes longer web browsing.</p> <p data-bbox="499 1177 1879 1250">https://www.qualcomm.com/products/application/smartphones/snapdragon-8-series-mobile-platforms/snapdragon-8-plus-gen-1-mobile-platform</p>

¹ The Snapdragon SoC is charted as a representative product made used, sold, offered for sale, and/or imported by or on behalf of Qualcomm. The citations to evidence contained herein are illustrative and should not be understood to be limiting. The right is expressly reserved to rely upon additional or different evidence, or to rely on additional citations to the evidence cited already cited herein.

 “Integrated circuit and method of communication service mapping”

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
	<p align="center">Certain Arteris Technology Assets Acquired</p> <p align="center">by Kurt Shuler, on October 31, 2013</p> <p>Arteris to continue to license, support and maintain Arteris FlexNoC® interconnect IP</p> <p>SUNNYVALE, California — October 31, 2013 — Arteris Inc., a leading innovator and supplier of silicon-proven commercial network-on-chip (NoC) interconnect IP solutions, today announced that Qualcomm Technologies, Inc. (“Qualcomm”), a subsidiary of Qualcomm Incorporated, has acquired certain technology assets from Arteris and hired personnel formerly employed by Arteris.</p> <p>“ <i>Arteris NoC technology has been and will continue to be a key enabler for creating larger and more complex chips in a shorter amount of time at a lower cost. This acquisition of our technology assets represents a validation of the value of Arteris’ Network-on-Chip interconnect IP technology.</i></p> <p align="right">ARTERIS^{IP}</p> <p align="right"><i>K. Charles Janac, President and CEO, Arteris</i></p> <p>As part of the acquisition transaction, Arteris retains the right to license, support and maintain the existing Arteris FlexNoC and Arteris FlexLLI product lines in order to fulfill existing and new licensing contracts. Qualcomm has agreed to make certain FlexNoC updates available to Arteris based upon an agreed upon schedule and provide certain engineering support to Arteris. Arteris has rights to make customer support-related modifications to FlexNoC. There are no changes in Arteris’ contractual obligations or operations with customers or industry partners.</p> <p>https://www.arteris.com/press-releases/Qualcomm-Arteris-asset-acquisition-2013_oct_31; https://www.fiercewireless.com/tech/qualcomm-acquires-arteris-noc-tech-assets-team</p> <p>The Arteris NoC performs communication service mapping in the Snapdragon SoC.</p>

U.S. Patent No. 7,594,052 (Radulescu & Goossens)

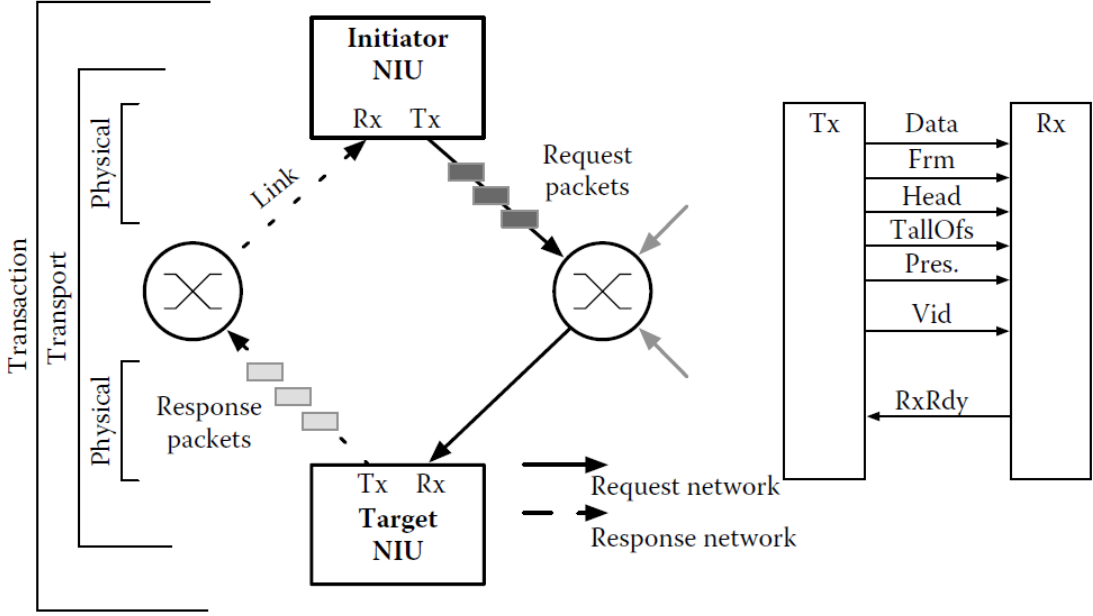

“Integrated circuit and method of communication service mapping”

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
	<p>For example, the Arteris NoC uses Network Interface Units (NIUs), which “translate[] between third-party [OCP, AMBA AHB, APB, and AXI protocols] and NTTP protocols” and in the Arteris NoC “[m]ost transactions require the following two-step transfers,” including “[a] master send[ing] request packets” and “the slave return[ing] response packets”:</p> <p>11.3.1.1 Transaction Layer</p> <p>The transaction layer is compatible with bus-based transaction protocols used for on-chip communications. It is implemented in NIUs, which are at the boundary of the NoC, and translates between third-party and NTTP protocols. Most transactions require the following two-step transfers:</p> <ul style="list-style-type: none"> • A master sends request packets. • Then, the slave returns response packets. <p>As shown in Figure 11.1, requests from an initiator are sent through the master NIU’s transmit port, Tx, to the NoC request network, where they are routed to the corresponding slave NIU. Slave NIUs, upon reception of request packets</p>

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
	<p>on their receive ports, Rx, translate requests so that they comply with the protocol used by the target third-party IP node. When the target node responds, returning responses are again converted by the slave NIU into appropriate response packets, then delivered through the slave NIU's Tx port to the response network. The network then routes the response packets to the requesting master NIU, which forwards them to the initiator. At the transaction level, NIUs enable multiple protocols to coexist within the same NoC. From the point of view of the NTTP modules, different third-party protocols are just packets moving back and forth across the network.</p>

	<p data-bbox="514 267 919 305">11.3.1.2 Transport Layer</p> <p data-bbox="514 321 1709 743">The Arteris NTTP protocol is packet-based. Packets created by NIUs are transported to other parts of the NoC to accomplish the transactions that are required by foreign IP nodes. All packets are comprised of cells: a header cell, an optional necker cell, and possibly one or more data cells (for packet definition see Figure 11.2; further descriptions of the packet can be found in the next subsection). The header and necker cells contain information relative to routing, payload size, packet type, and the packet target address. Formats for request packets and response packets are slightly different, with the key difference being the presence of an additional cell, the necker, in the request packet to provide detailed addressing information to the target.</p> <p data-bbox="514 764 632 797"><i>Id.</i> at 313.</p> <p data-bbox="514 846 1803 997">As yet a further illustration, packets in the Arteris NoC are “delivered as words that are sent along links and “[o]ne link (represented in Figure 11.1) defines the following signals,” which include “the current priority of the packet used to define preferred traffic class (or Quality of Service)” and “[f]low control”:</p>

U.S. Patent No. 7,594,052 (Radulescu & Goossens)

“Integrated circuit and method of communication service mapping”

maximum cell-width (header, necker, and data cell) and the link-width. One link (represented in [Figure 11.1](#)) defines the following signals:

- **Data**—Data word of the width specified at design-time.
- **Frm**—When asserted high, indicates that a packet is being transmitted.
- **Head**—When asserted high, indicates the current word contains a packet header. When the link-width is smaller than single (SGL), the header transmission is split into several word transfers. However, the Head signal is asserted during the first transfer only.
- **TailOfs**—Packet tail: when asserted high, indicates that the current word contains the last packet cell. When the link-width is smaller than single (SGL), the last cell transmission is split into several word transfers. However, the Tail signal is asserted during the first transfer only.
- **Pres.**—Indicates the current priority of the packet used to define preferred traffic class (or Quality of Service). The width is fixed during the design time, allowing multiple pressure levels within the same NoC instance (bits 3–5 in [Figure 11.2](#)).
- **Vld**—Data valid: when asserted high, indicates that a word is being transmitted.
- **RxRdy**—Flow control: when asserted high, the receiver is ready to accept word. When de-asserted, the receiver is busy.

This signal set, which constitutes the Media Independent NoC Interface (MINI), is the foundation for NTPP communications.

This is illustrated in Figure 11.1, with one master and one slave node, and one router in the request and response path.”</p>  <p>FIGURE 11.1 NTTP protocol layers mapped on NoC units and Media Independent NoC Interface—MINI.</p> <p>See Networks-On-Chips Theory and Practice, https://vdoc.pub/download/networks-on-chips-theory-and-practice-embedded-multi-core-systems-6f26qivv11f0, at 312-313.</p>

U.S. Patent No. 7,594,052 (Radulescu & Goossens)*“Integrated circuit and method of communication service mapping”*

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
	<p>The “Arteris NTTP protocol is packet-based” and the packets, which have “header and necker cells [that] contain information relative to routing, payload size, packet type, and the packet target address,” are “transported to other parts of the NoC to accomplish the transactions that are required by foreign IP nodes”:</p> <p>11.3.1.2 Transport Layer</p> <p>The Arteris NTTP protocol is packet-based. Packets created by NIUs are transported to other parts of the NoC to accomplish the transactions that are required by foreign IP nodes. All packets are comprised of cells: a header cell, an optional necker cell, and possibly one or more data cells (for packet definition see Figure 11.2; further descriptions of the packet can be found in the next subsection). The header and necker cells contain information relative to routing, payload size, packet type, and the packet target address. Formats for request packets and response packets are slightly different, with the key difference being the presence of an additional cell, the necker, in the request packet to provide detailed addressing information to the target.</p> <p><i>Id.</i> at 313.</p> <p>As a further illustration, packets in the Arteris NoC are “delivered as words that are sent along links and “[o]ne link (represented in Figure 11.1) defines the following signals,” which include “the current priority of the packet used to define preferred traffic class (or Quality of Service)” and “[f]low control”:</p>

U.S. Patent No. 7,594,052 (Radulescu & Goossens)

“Integrated circuit and method of communication service mapping”

maximum cell-width (header, necker, and data cell) and the link-width. One link (represented in [Figure 11.1](#)) defines the following signals:

- **Data**—Data word of the width specified at design-time.
- **Frm**—When asserted high, indicates that a packet is being transmitted.
- **Head**—When asserted high, indicates the current word contains a packet header. When the link-width is smaller than single (SGL), the header transmission is split into several word transfers. However, the Head signal is asserted during the first transfer only.
- **TailOfs**—Packet tail: when asserted high, indicates that the current word contains the last packet cell. When the link-width is smaller than single (SGL), the last cell transmission is split into several word transfers. However, the Tail signal is asserted during the first transfer only.
- **Pres.**—Indicates the current priority of the packet used to define preferred traffic class (or Quality of Service). The width is fixed during the design time, allowing multiple pressure levels within the same NoC instance (bits 3–5 in [Figure 11.2](#)).
- **Vld**—Data valid: when asserted high, indicates that a word is being transmitted.
- **RxRdy**—Flow control: when asserted high, the receiver is ready to accept word. When de-asserted, the receiver is busy.

This signal set, which constitutes the Media Independent NoC Interface (MINI), is the foundation for NTPP communications.

U.S. Patent No. 7,594,052 (Radulescu & Goossens)*“Integrated circuit and method of communication service mapping”*

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
	<p><i>Id.</i> at 313-314.</p> <p>As yet a further illustration, the Arteris NoC implements Quality of Service (QoS) to “provide[] a regulation mechanism allowing specification of guarantees on some of the parameters related to the traffic”; QoS, which includes guarantees of, for example, throughput and/or latency, “is achieved by exploiting the signal pressure embedded into the NTTP packet definition” where the “pressure signal can be generated by the IP itself and is typically linked to a certain level of urgency with which the transaction will have to be completed”; and the “pressure information will be embedded in the NTTP packet at the NIU level”:</p> <p>Quality of Service (QoS). The QoS is a very important feature in the inter-connect infrastructures because it provides a regulation mechanism allowing specification of guarantees on some of the parameters related to the traffic. Usually the end users are looking for guarantees on bandwidth and/or end-to-end communication latency. Different mechanisms and strategies have been proposed in the literature. For instance, in <i>Æthereal NoC</i> [11,24] proposed by NXP, a TDMA approach allows the specification of two traffic categories [25]: BE and GT.</p> <p>In the Arteris NoC, the QoS is achieved by exploiting the signal pressure embedded into the NTTP packet definition (Figures 11.1 and 11.2). The pressure</p>

	<p>signal can be generated by the IP itself and is typically linked to a certain level of urgency with which the transaction will have to be completed. For example, we can imagine associating the generation of the pressure signal when a certain threshold has been reached in the FIFO of the corresponding IP. This pressure information will be embedded in the NTTP packet at the NIU level: packets that have pressure bits equal to zero will be considered without QoS; packets with a nonzero value of the pressure bit will indicate preferred traffic class.* Such a QoS mechanism offers immediate service to the most urgent inputs and variables, and fair service whenever there are multiple contending inputs of equal urgency (BE). Within switches, arbitration decisions favor preferred packets and allocate remaining bandwidth (after preferred packets are served) fairly to contending packets. When there are contending preferred packets at the same pressure level, arbitration decisions among them are also fair.</p> <p>The Arteris NoC supports the following four different traffic classes:</p>

U.S. Patent No. 7,594,052 (Radulescu & Goossens)

“Integrated circuit and method of communication service mapping”

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
	<ul style="list-style-type: none"> • Real time and low latency (RTLL)—Traffic flows that require the lowest possible latency. Sometimes it is acceptable to have brief intervals of longer latency as long as the average latency is low. Care must be taken to avoid starving other traffic flows as a side effect of pursuing low latency. • Guaranteed throughput (GT)—Traffic flows that must maintain their throughput over a relatively long time interval. The actual bandwidth needed can be highly variable even over long intervals. Dynamic pressure is employed for this traffic class. • Guaranteed bandwidth (GBW)—Traffic flows that require a guaranteed amount of bandwidth over a relatively long time interval. Over short periods, the network may lag or lead in providing this bandwidth. Bandwidth meters may be inserted onto links in the NoC to regulate these flows, using either of the two methods. If the flow is assigned high pressure, the meter asserts backpressure (flow control) to prevent the flow from exceeding a maximum bandwidth. Alternatively, the meter can modulate the flows pressure (priority) dynamically as needed to maintain an average bandwidth. • Best effort (BE)—Traffic flows that do not require guaranteed latency or throughput but have an expectation of fairness.

* Note that in the NTTP packet, the pressure field allows more then one bit, resulting in multiple levels of preferred traffic.

Networks-On-Chips Theory and Practice, <https://vdoc.pub/download/networks-on-chips-theory-and-practice-embedded-multi-core-systems-6f26qivv11f0>, at 315-316.

Connections within the Arteris NoC interconnect may be defined by a connectivity table:

Connectivity Map → Interconnect Connections → Layout

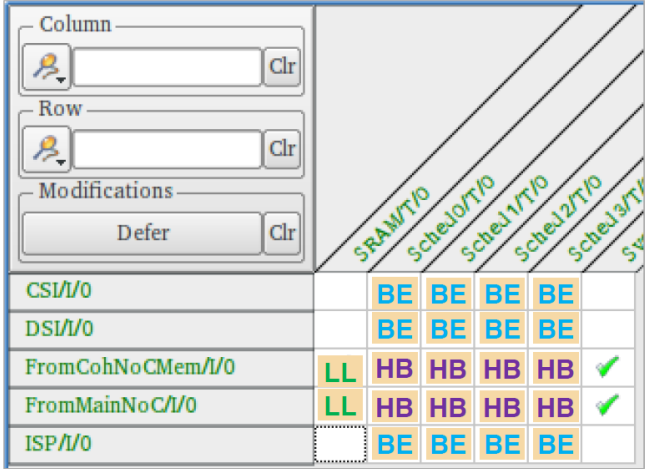

- Connectivity table defines interconnect connections within the floorplan
- Routes must pass through available channels in the floorplan
- Connectivity passes from initiator NIU to switch, to link, to RC buffers and finally to target NIU

DC-Topographical

It is implemented in NIUs, which are at the boundary of the NoC, and translates between third-party and NTTP protocols. Most transactions require the following two-step transfers:</p> <ul data-bbox="594 553 1352 654" style="list-style-type: none"> • A master sends request packets. • Then, the slave returns response packets. <p data-bbox="520 703 1854 1284">As shown in Figure 11.1, requests from an initiator are sent through the master NIU's transmit port, Tx, to the NoC request network, where they are routed to the corresponding slave NIU. Slave NIUs, upon reception of request packets on their receive ports, Rx, translate requests so that they comply with the protocol used by the target third-party IP node. When the target node responds, returning responses are again converted by the slave NIU into appropriate response packets, then delivered through the slave NIU's Tx port to the response network. The network then routes the response packets to the requesting master NIU, which forwards them to the initiator. At the transaction level, NIUs enable multiple protocols to coexist within the same NoC. From the point of view of the NTTP modules, different third-party protocols are just packets moving back and forth across the network.</p> <p data-bbox="506 1341 695 1373"><i>Id.</i> at 312-313.</p>

This pressure information will be embedded in the NTTP packet at the NIU level: packets that have pressure bits equal to zero will be considered without QoS; packets with a nonzero value of the pressure bit will indicate preferred traffic class.* Such a QoS mechanism offers immediate service to the most urgent inputs and variables, and fair service whenever there are multiple contending inputs of equal urgency (BE). Within switches, arbitration decisions favor preferred packets and allocate remaining bandwidth (after preferred packets are served) fairly to contending packets. When there are contending preferred packets at the same pressure level, arbitration decisions among them are also fair.</p> <p>The Arteris NoC supports the following four different traffic classes:</p>

U.S. Patent No. 7,594,052 (Radulescu & Goossens)

“Integrated circuit and method of communication service mapping”

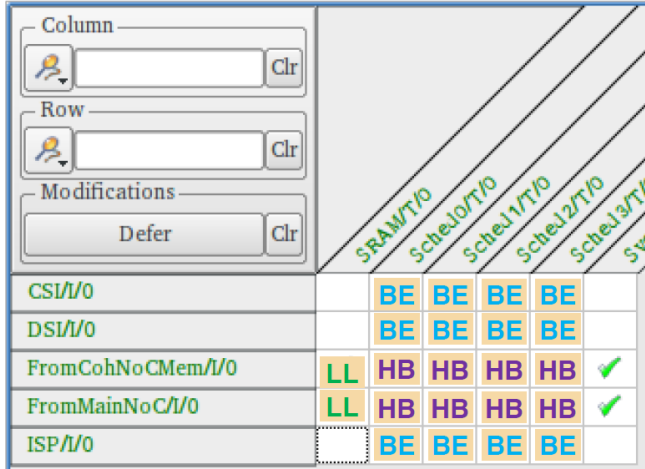

'052 Patent Claim	Qualcomm Snapdragon 8+ Gen 1 Mobile Platform System on Chip ¹
	<ul style="list-style-type: none"> • Real time and low latency (RTLL)—Traffic flows that require the lowest possible latency. Sometimes it is acceptable to have brief intervals of longer latency as long as the average latency is low. Care must be taken to avoid starving other traffic flows as a side effect of pursuing low latency. • Guaranteed throughput (GT)—Traffic flows that must maintain their throughput over a relatively long time interval. The actual bandwidth needed can be highly variable even over long intervals. Dynamic pressure is employed for this traffic class. • Guaranteed bandwidth (GBW)—Traffic flows that require a guaranteed amount of bandwidth over a relatively long time interval. Over short periods, the network may lag or lead in providing this bandwidth. Bandwidth meters may be inserted onto links in the NoC to regulate these flows, using either of the two methods. If the flow is assigned high pressure, the meter asserts backpressure (flow control) to prevent the flow from exceeding a maximum bandwidth. Alternatively, the meter can modulate the flows pressure (priority) dynamically as needed to maintain an average bandwidth. • Best effort (BE)—Traffic flows that do not require guaranteed latency or throughput but have an expectation of fairness.
